

ENOVIA SYSTEM PERFORMANCE ASSESSMENT

A SMARTER APPROACH TO YOUR PERFORMANCE ISSUES

When you need performance improvements, choose Dassault Systèmes - the team with the experience to deliver results

PLM EXPERTISE

Address specific performance issues in your ENOVIA systems and create a viable environment that improves stability and performance. The Dassault Systèmes Industry Services team works with you to perform a Performance Assessment Workshop to streamline infrastructure performance, identify and resolve performance complaints, reduce performance gaps, enhance query operation, refine application code, improve data consistency and load times and increases load testing accuracy.

PERFORMANCE ASSESSMENT WORKSHOP

The Performance Assessment Workshop is implemented in three significant phases:

- Investigation Phase
- Implementation / Assessment Phase
- Validation Phase

Investigation Phase

Gain a functional and technical understanding of your application and environment to better assess performance issues. This portion of the workshop will define patterned flaws in your system and identify areas with the largest performance improvement potential. We will generate a performance report that outlines the problem, process descriptions and our recommendations.

Implementation / Assessment Phase

Based on findings from the Investigation Phase, we identify items that can be resolved quickly and improve performance, and also those that may require additional work such as code changes, specifications or modified business processes.

Validation Phase

Validate the environment and recommendations to ensure stability and performance gains from the Investigation and Implementation / Assessment Phases.

Sustainability Roadmap

After a successful performance improvement, it's essential to maintain the new performance benchmark. The Dassault Systèmes Industry Services Sustainability Roadmap provides guidelines for maintaining your improvements, such as:

- Performance development
- Load testing as part of the release process
- System maintenance
- Identifying usage pattern shifts before they occur
