

CONNECTOR FOR CADENCE ALLEGRO HDL

OBJECTIVE

Connector for Cadence Allegro HDL manages Allegro Project Manager, Design Entry HDL and PCB Design Editor designs to accelerate product development. It leverages the design team collaboration capabilities of **Collaborative Innovation** to facilitate a concurrent printed circuit board (PCB) design process resulting in fewer engineering changes and lower production costs.

OVERVIEW

Ensuring that the right design data are being properly shared and managed across the value chain (a company's suppliers, partners and customers) is vital to a company's ability to bring products to market quickly and correctly the first time. In PCB designs, this effort is complicated by several factors including that electronic designs are growing exponentially in complexity (creating several gigabytes of data) and that corporations have geographically dispersed design teams across multiple time zones. As design and manufacturing functions continue to occur outside the walls of an organization, it is increasingly critical that all members contributing to the PCB design process have full access to the most recent design data, when they need it and wherever they are located. **Connector for Cadence Allegro HDL** allows PCB development teams to collaborate during the board design process, and to collect, track, protect and deliver product design information seamlessly across Electronic Computer Aided Design (ECAD) systems and other enterprise applications.

Connector for Cadence Allegro HDL provides a simple, yet secure, workgroup and enterprise data management system that integrates directly into ECAD design environments, allowing a designer to share electronic design data easily with other designers, enterprise users and partners. The product facilitates the concurrent PCB design resulting in fewer engineering changes, shorter development times and lower production costs. With this product, schematic and layout designers can work either concurrently on the same design while keeping design databases synchronized (i.e. components, connectivity, properties, etc.) or on different hierarchical blocks of the schematic design, independently revising their designs in the same project.

Connector for Cadence Allegro HDL is intended to work with **Collaborative Innovation** and create a collaborative environment for managing design data from multiple ECAD and/or Mechanical Computer Aided Design (MCAD) tools. With **Collaborative Innovation**, the Cadence Allegro users are able to:

- Independently manage various aspects of the design facilitating collaboration, including the entire schematic hierarchy, PCB layout, and project directory.
- Create derived outputs (i.e. manufacturing data automatically generated by the ECAD application).
- Manage design variants as defined in the ECAD application, each with its own derived outputs.
- Manage annotation files for the purpose of collaboration with the PCB layout.
- Assign the design to workspace folders to facilitate collaboration.
- Synchronize attributes between the ECAD library and parts in the 3DEXPERIENCE® platform.

HIGHLIGHTS

Connector for Cadence Allegro HDL enables electronic designers to collaborate on complex designs as well as share design information with the extended enterprise, thereby shortening development times, reducing design errors and introducing products to market faster.

Concurrent Design PCB Schematic and Layout

Schematic and layout designers have the freedom to work concurrently to shorten development times. As changes are made to the schematic and layout, synchronization is accomplished through forward and backward annotation files that can be accessed through shared workspace folders. Subscriptions allow the layout designer to be notified when the schematic design is checked-in by the logic designer. The relationships between schematics and layout are maintained so traceability is never lost even when working with third party designers.

Manage Team-Based Hierarchical Schematics

Top-down design methodology enables several designers to work concurrently on complex PCB projects. In this method, a PCB design is divided into logical, manageable blocks and each team member is allocated a block to capture and verify. **Connector for Cadence Allegro HDL** manages block-based designs within the same project. Project managers have visibility into multi-level and multi-page designs and can assign team members to implement the functionality underlying each block.

Flexible Design and Variant Configuration Management

Connector for Cadence Allegro HDL enables better control of design data through check-in and checkout of electrical design data and flexible configuration management. The product also supports unlimited board assembly variants without having to maintain duplicate schematics or manually edit bills of material (BOMs). This ensures there is one source of the truth for manufacturing.

BOM Management

A BOM can automatically be generated anytime during the design process for review by designers, procurement and component engineers to estimate cost, part status and availability. A preliminary BOM can be created for early concept design collaboration even before an ECAD design is formally managed in 3DEXPERIENCE platform. The design BOM can be modified by adding and removing parts manually or automatically by importing a parts list in a comma delimited format (CSV). The design BOM can be verified to ensure that the parts are available for production. When it is ready for collaboration the BOM can then be made available to users of **Engineering BOM Management** to create markups and add comments of proposed changes. Once approved, BOM markups can be applied to an Engineering Change Order (ECO) to automatically implement the change.

Library Information Management

By synchronizing part data between 3DEXPERIENCE platform and ECAD libraries, designers can make smarter component choices early in the design process reducing design iterations and product development times. This feature allows bi-directional transfer of part information, ensuring that data is synchronized as changes are made in either 3DEXPERIENCE platform or ECAD libraries. Therefore, designers can use native CAD tools to find PCB components and display 3DEXPERIENCE platform attributes.

Key Benefits:

- Maintain accurate representations of the intended design in the PLM database.
- Achieve centralized management of all CAD files.
- Control work-in-process, engineering changes, data, documents, and dynamic configurations.
- Give non-engineering personnel direct, task-specific access to current CAD data.
- Reduce the possibility of redundant, inaccurate, or out-of-date product information.
- Improve design control and business process management to realize truly functional product development and delivery.
- Reduce the number of design iterations by enabling enterprise collaboration throughout the design process between electrical and mechanical designers, purchasing, manufacturing, and partners while protecting intellectual property from unauthorized access.
- Reduce scrap and re-work costs by minimizing data transfer errors between engineering and manufacturing.
- Reduce ramp up production lead times by providing component information to your supply chain earlier in the development process through preliminary BOMs.

Furthermore, enterprise users can use 3DEXPERIENCE platform to find CAD parts and display CAD parameters. Synchronization is based on **Product Engineer** part types or **Classification Manager** classes. Batch mode allows updates to be made periodically or as needed.

Derived Outputs

Derived outputs such as netlists, drawing plots, milling data, artwork, drill data and other manufacturing information can be automatically generated and stored with the design.

Our 3DEXPERIENCE® platform powers our brand applications, serving 12 industries, and provides a rich portfolio of industry solution experiences.

Dassault Systèmes, the 3DEXPERIENCE® Company, provides business and people with virtual universes to imagine sustainable innovations. Its world-leading solutions transform the way products are designed, produced, and supported. Dassault Systèmes' collaborative solutions foster social innovation, expanding possibilities for the virtual world to improve the real world. The group brings value to over 190,000 customers of all sizes in all industries in more than 140 countries. For more information, visit www.3ds.com.
