

Isight 5.7

Installation Guide

Legal Notices

Isight and the SIMULIA Execution Engine are products of Dassault Systèmes Simulia Corp., Providence, Rhode Island, USA. These products may be used or reproduced only in accordance with the terms of such license.

This documentation is subject to the terms and conditions of either the software license agreement signed by the parties, or, absent such an agreement, the then current software license agreement to which the documentation relates.

This documentation and the software described in this documentation are subject to change without prior notice. No part of this documentation may be reproduced or distributed in any form without prior written permission of Dassault Systèmes or its subsidiary.

© Dassault Systèmes, 2012.

Isight, Abaqus, the 3DS logo, and SIMULIA are trademarks or registered trademarks of Dassault Systèmes or its subsidiaries in the United States and/or other countries. Other company, product, and service names may be trademarks or service marks of their respective owners. For additional information concerning trademarks, copyrights, and licenses, see the notices at

`<isight_install_directory>\Doc\Third_Party_Products.html`.

OPEN SOURCE PROGRAMS: This release of Isight and the SIMULIA Execution Engine uses several open source or free programs (“OS Programs”). Each such program is distributed with the Isight and the SIMULIA Execution Engine Software in binary form and, except as permitted by the applicable license, without modification. Each such program is available online for free downloading and, if required by the applicable OS Program license, the source code will be made available by Dassault Systèmes or its subsidiary upon request. For a complete list of OS Programs utilized by Isight and the SIMULIA Execution Engine, as well as licensing documentation for these programs, see

`<isight_install_directory>\Doc\Third_Party_Products.html`.

Dassault Systèmes or its subsidiaries may have patents or pending patent applications, trademarks, copyrights, or other intellectual property rights covering the Isight and the SIMULIA Execution Engine Software and/or its documentation. No license of such patents, trademarks, copyrights, or other intellectual property rights is provided or implied except as may be expressly provided in a written license agreement from Dassault Systèmes or its subsidiary.

Locations

SIMULIA welcomes any suggestions for improvements to Isight software, the support program, or documentation. We welcome any suggestions for improvements to Isight software, the support program, or documentation . If you wish to make a suggestion about the service or products, refer to <http://www.3ds.com/products/simulia>. Complaints should be addressed by contacting your local office or through <http://www.3ds.com/products/simulia>.

Preface

This section lists various resources that are available for help with using SIMULIA software, including technical engineering and systems support, training seminars, and documentation.

Platform Information

SIMULIA applications are supported on a variety of platforms. For complete details on supported platforms, refer to <http://www.3ds.com/support/certified-hardware/simulia-system-information/>

Support

Both technical engineering support (for problems with creating a model or performing an analysis) and systems support (for installation, licensing, and hardware-related problems) for Isight are offered through a network of local SIMULIA support offices.

SIMULIA Online Support System

SIMULIA Execution Engine Express is easier to install than the standard SIMULIA Execution Engine. The server and database are installed with the software and are pre-configured and ready to execute. SIMULIA provides a knowledge database of answers and solutions to questions that we have answered, as well as guidelines on how to use Abaqus, SIMULIA Scenario Definition, Isight, SIMULIA Execution Engine, and other SIMULIA products. You can also submit new requests for support. All support incidents are tracked. If you contact us by means outside the system to discuss an existing support problem and you know the incident or support request number, please mention it so that we can query the database to see what the latest action has been.

Many questions can also be answered by visiting <http://www.3ds.com/products/simulia>. The information available online includes:

- Systems information and computer requirements
- Performance data
- Status reports
- Training seminar schedule
- INSIGHTS Magazine/Realistic Simulation News Magazine
- Technology briefs
- Customer conference papers

Technical Engineering Support

Technical support engineers are available to assist in clarifying product features and checking errors by giving both general information on using the product and information on its application to specific analyses. If you have concerns about an analysis, we suggest that you contact us at an early stage, since it is usually easier to solve problems at the beginning of a project rather than trying to correct an analysis at the end.

Please have the following information ready before contacting the technical engineering support hotline, and include it in any written contacts:

-
- The release of Isight that are you using, which can be obtained by accessing the VERSION file at the top level of your Isight installation directory.
 - The type of computer on which you are running Isight.
 - The symptoms of any problems, including the exact error messages, if any.
 - Any log files associated with the error.
 - Workarounds or tests that you have already tried.

When contacting support about a specific problem, any available product output files may be helpful in answering questions that the support engineer may ask you.

The support engineer will try to diagnose your problem from the model description and a description of the difficulties you are having. The more detailed information you provide, the easier it will be for the support engineer to understand and solve your problem.

If the support engineer cannot diagnose your problem from this information, you may be asked to supply a model file. The data can be attached to a support incident in the online system. It can also be sent by means of e-mail, disk, or ftp. Please check the **Support** page at <http://www.3ds.com/products/simulia> for the media formats that are currently accepted.

If you are contacting us via telephone to discuss an existing problem, please give the receptionist the support engineer's name. If you are contacting us via e-mail, please include the support engineer's name at the top of any e-mail correspondence. If you are contacting us online (preferred for written communication), update the existing incident/support request for the problem.

Systems Support

Systems support engineers can help you resolve issues related to the installation and running of the product, including licensing difficulties, that are not covered by technical engineering support.

You should install the product by carefully following the instructions in the installation guide. If you encounter problems with the installation or licensing, first review the instructions in the installation guide to ensure that they have been followed correctly. If this does not resolve the problems, consult the knowledge database for information about known installation problems. If this does not address your situation, please create an incident/support request in the online system and describe your problem.

Anonymous FTP Site

To facilitate data transfer with SIMULIA, an anonymous ftp account is available on the computer `ftp.simulia.com`. Login as user `anonymous`, and type your e-mail address as your password. Contact support before placing files on the site.

Contacting Technical Support

Use the **Support** page at <http://www.3ds.com/products/simulia>, or obtain local support office contact information from the **Locations** page at <http://www.3ds.com/products/simulia>.

In addition, contact information for offices and representatives is listed in the preface.

Support for Academic Institutions

Under the terms of the Academic License Agreement we do not provide support to users at academic institutions. Academic users can purchase technical support on an hourly basis. For more information, please see <http://www.3ds.com/products/simulia> or contact your local support office.

Training

SIMULIA offices offer regularly scheduled public training classes, including classes on Isight. SIMULIA offices also provide training seminars at customer sites. All training classes and seminars include workshops to provide practical experience with our products. For a schedule and description of available classes, see the **Services** page at <http://www.3ds.com/products/simulia> or call your local representative.

Feedback

SIMULIA welcomes any suggestions for improvements to Isight software, the support program, or documentation. If you wish to make a suggestion about the service or products, refer to <http://www.3ds.com/products/simulia>. Complaints should be addressed by contacting your local office or through <http://www.3ds.com/products/simulia>.

Installation Roadmap

This guide discusses the installation and configuration of Isight.

A standard Isight installation includes everything you need to create and execute design studies, as well as tools for analyzing your results and saving your data.

[Key Concepts](#) describes the fundamental terminology and ideas that are used throughout the manual. You should review [System Requirements](#) and [Supported Platforms](#) to ensure you have all of the appropriate prerequisites.

The following table outlines the tasks required to install and configure Isight:

Goal	Task	Contents
Installing Isight	Installation Overview	Summary of the installation tasks that must be performed.
	Installing or Configuring Licensing	Instructions for installing the license server software.
	Installing Isight Desktop	Instructions for installing the product on Windows and UNIX/Linux operating systems.
	Migrating Your Old Database to the New Format	Information about migrating your existing Isight database to the format of the new release's database.
	Uninstalling Isight	Instructions on how to permanently remove Isight from your system.
Configuration	User Login Names Containing Punctuation	Instructions on how to alter your Isight installation if your user name contains punctuation marks.
	Required Changes for UNIX/Linux Systems	Instructions on necessary changes in your UNIX/Linux environment to allow Isight to run properly.
	Configuring Your FLEXnet License to Work with a Windows Firewall	Instructions on how to update your license file to point to a license server that resides behind a Windows firewall.

What's New?

This section describes the new and enhanced functionality in the Isight installer.

New Functionality

About Licensing and License Files

You can use either FLEXnet licensing or Dassault Systèmes (DS) licensing with Isight, depending on which type of license file you have. The Isight installer lets you choose which type of license server software to install. If you are not sure which type of license file you have, ask your DS SIMULIA sales representative.

Isight Distributed Execution

Isight now supports distributed execution via station processes running on different machines. The installer will prompt whether to make local execution or distributed execution the default for each copy of Isight installed. This decision can be changed later by creating a new logon profile (.cpr file). The installer gives you the option of installing only an Isight station.

Enhanced Functionality

Installer Changes

The installer no longer publishes components to the Isight library, nor does it try to migrate results from an earlier Isight installation. These steps are performed automatically the first time the Isight Design Gateway is started.

The installer no longer has the option to install code for multiple platforms (e.g., Solaris, AIX, and Linux) in a single pass. If it is desired to install Isight for multiple platforms in the same directory, the appropriate platform installers must be run one at a time. Each installer must be run on a machine of the appropriate type; for example, the AIX installer can be run only on AIX, and so on.

The FLEXnet license server installer does not register the license server as a service on UNIX/Linux. This can be done later if required.

Key Concepts

There are several processes to follow when you install and configure Isight. You should understand the details of these processes before proceeding with any installation or configuration tasks.

About Licensing and License Files

During the installation of Isight, you will be asked to supply information about your license key file or license server.

You can use either FLEXnet licensing or Dassault Systèmes (DS) licensing with Isight, depending on which type of license key file you have. The Isight installer lets you choose which type of license server software to install. If you are not sure which type of license key file you have, ask your DS SIMULIA sales representative.

If you have already received a license file for Isight, be sure that you know the location of the license file on your (local) computer or the information for the computer acting as a license server. You will have to specify this information during the installation process.

If you are installing Isight in a stand-alone environment, the licensing installer will install and start the license server software. If you are installing in a network environment, you need to install a license server once on the host computer and specify the license server machine host name and port number for each installation on a client machine.

You must have your license key file before installing the DS or FLEXnet license server software, and you must install and start the license server program before installing Isight on any client machines.

All licenses for an Isight/SIMULIA Execution Engine job must reside on the same server. For example, a job that contains a DOE component and a Taguchi component must obtain licenses for both components from a single server. The job cannot use a DOE license from one server and a Taguchi license from another server.

The Isight desktop product installer generates a small configuration file that specifies which type of licensing is being used:

```
<isight_install_dir>/config/licenseSystem.dat
```

For example, on Windows the default location of the file would be:

```
C:\SIMULIA\Isight\5.7\config\licenseSystem.dat
```

The default is to use FLEXnet; however, if DSLS licensing is to be used, the file contains a single line:

```
DSLS
```

Dassault Systèmes Licensing

The Dassault Systèmes license server software package includes the *DS License Server Installation and Configuration Guide* (DSLS.pdf), which contains instructions for configuring the license server and administering licenses. Refer to this guide for all Dassault Systèmes licensing operations. The DSLS.pdf file is installed in the /Docs/ subdirectory of your Isight installation; for example, under C:\SIMULIA\Isight\5.7\Docs\.

After the DS license server installation finishes, you must use the DS License Administration Tool to enroll the Isight licenses for individual users; see “Enrolling Product Licenses” in the *DS License Server Installation and Configuration Guide*.

Note: Virtual machines, such as VMware, are not supported for DS licensing. It is not possible to install or run the Dassault Systèmes license server on a virtual machine.

FLEXnet Licensing

FLEXnet licensing for Isight uses FLEXnet Version 11.6.1, and Isight 5.7 requires lmgrd Version 11.6.1 or higher. If you integrate your Isight license features with other products using a FLEXnet combined license file, ensure that your version of lmgrd meets this requirement.

For more information, refer to the *FLEXnet License Administration Guide* Version 11.6.1, which is available for download from the **Licensing** section of the **Support** page at www.3ds.com/simulia.

Note: FLEXnet licenses are not supported (either for server or client) on Sun Solaris.

Client and Server License Files

The license server installers generate a server license file in either `C:\SIMULIA\License\` (on Windows) or `/opt/SIMULIA/License/` (on UNIX/Linux) by default. The Isight desktop installer generates one of the following client license files in each installation:

```
<isight_install_dir>/config/license.dat      (for FLEXnet)
<isight_install_dir>/config/DSLicSrv.txt    (for DSLS)
```

The FLEXnet `license.dat` client file is a `USE_SERVER` file that has the following contents when a single license server is installed:

```
SERVER hostname ANY port
USE_SERVER
```

The default port number is 1736. The port number is not actually required, however.

If your organization uses a central FLEXnet license server, you can edit the `license.dat` file to point to your central server. You can also combine the license files for all products using FLEXnet. For more details, refer to the *FLEXnet License Administration Guide* Version 11.6.1, which is available for download from the **Licensing** section of the **Support** page at www.3ds.com/simulia.

If you choose to install a FLEXnet triple-redundant license server, the `license.dat` client file has the following contents:

```
SERVER hostname1 ANY
SERVER hostname2 ANY
SERVER hostname3 ANY
USE_SERVER
```

The DSLS `DSLicSrv.txt` client file contains one host per line with the format:

```
hostname:port
```

The default port number is 4085. A port number must always be specified for DSLS.

The `DSLicSrv.txt` file can contain multiple entries for multiple license server host machines. Isight will contact each server in turn until it finds one that has Isight licenses. Isight then checks out all licenses from that one DSLS server.

Installing as an Administrator (Windows) or Non-Root User (UNIX/Linux)

You must be an Administrator user on Windows to install Isight. On UNIX/Linux, however, root privileges are not required.

Windows

You must use an Administrator user account on Windows to install Isight because the installer must install Microsoft Visual C++ runtime libraries in the `C:\WINDOWS\WinSxS\` directory. Microsoft's User Account Control (UAC) feature enforces this requirement on Windows 7, Windows Vista, and Windows 2008 Server. On Windows XP and Windows 2003 Server, the Isight installer will exit with an error message if you attempt to run it as a non-administrator user. This requirement applies to both 32-bit Windows and 64-bit Windows.

Installing the license server for Isight also requires Administrator privileges.

UNIX/Linux

Root (superuser) privileges are not required to install Isight on UNIX or Linux, and it is recommended that you install Isight as a non-root user. However, root permissions are usually needed beforehand to grant the installing user write access to the installation directory; for example, in `/opt/SIMULIA/Isight`.

As a non-root user, you can install Isight in any directory to which you have write access. If an administrator creates a directory called `/opt/SIMULIA/Isight` and makes it writable, a non-root user can also install in `/opt`.

The FLEXnet license server software should be installed similarly, by a non-root user.

The DS license server, however, does require root privileges to install. In addition, you cannot use the `su` command to become root and run the DS licensing installer—this leaves the environment in an incorrect state. Instead, you must log out and log back in as root, or become root using the command "`su -`" (su space dash) to force the environment to be reset as though root had logged in.

After you install Isight and the license server software, the following (optional) steps will require root privileges:

- Configuring the FLEXnet license server to run as a service; i.e., an application that automatically starts (from `/etc/rc/`) when the computer reboots. For details, see [Configuring the FLEXnet License Server After Installation](#).
- Configuring an Isight distributed execution station to run as a service.

Installing on a Shared/Network Disk

Instead of using the Isight DVD on each computer that will be running Isight, you can copy the contents of the DVD to a shared or network disk and run the installer from there.

On Windows, Isight is usually installed separately on each computer. This configuration gives the best performance and stability. To avoid using the installation DVD with each computer, you can copy the contents of the DVD to a shared directory. Once the installation files are available from a shared directory, you can access and execute them on each computer that will be running Isight. You must copy the entire contents of the DVD, including all subdirectories and utility files.

On UNIX/Linux, Isight can be installed separately on each computer, but it is common to install it on a shared disk (i.e., network file system, NFS, or NAS). When using a shared disk, you just install once from a computer that has a DVD drive onto a network file system. Computers that will run Isight jobs overnight have Isight installed on a local disk, or should use an NFS “hard” mount for the shared file system to minimize the effects

of any network disruptions. A “hard” mount will continue retrying indefinitely after a network error, pausing the process but not causing a job execution error.

Running Isight from a Shared Directory on Windows

Isight is typically installed into a local directory on each computer that will be running it. However, it is possible to run Isight from a shared directory on another computer or NAS device.

When running Isight using this method, you should be aware of the following limitations:

- You will need to document a procedure for starting the Isight features (Design Gateway, Runtime Gateway, etc.), since your users will not have access to the Isight Start Menu options or desktop icons.
- The Microsoft Visual C++ runtime libraries must still be installed on each computer by executing the proper program from the `Prerequisites\` directory on the Isight DVD). You must be an Administrator to perform this installation. Execute the file `installDSSoftwareVC9Prerequisites_x86.msi` on a 32-bit Windows machine or `installDSSoftwareVC9Prerequisites_x86_x64.msi` on a 64-bit Windows machine.
- If the shared folder becomes unavailable for more than 5 minutes (for example, while nightly network backups are running), long-running Isight jobs may fail. This problem occurs because the network file access protocol only retries failed operations for a few minutes before returning a fatal error.

Assumed Windows Default Settings

All the procedures in this manual assume that you are using the default Windows settings for certain components in your operating system. It is recommended that you change the settings as described in the given procedures. Doing so will help you avoid confusion when installing Isight. After installing the software, you can revert back to your old settings if desired.

Three of the Windows settings—the Start menu, the Control Panel, and folder and file extension options—can affect the installation process for Isight. If you are using non-default settings for these components, you may have difficulty following the installation procedures. Follow the instructions given to determine which settings you are currently using.

Determining the Start Menu Setting

The Windows Start Menu is used to access certain configuration features following the installation of Isight. It is also used when uninstalling the product.

Note: This section does not apply to the Windows 7 or Windows 2008 operating systems. These operating systems do not have multiple settings as described in the following procedure.

1. Right-click the **Start** button, and select **Properties**.

The **Properties** dialog box appears.

2. Verify that the **Start Menu** tab is selected.

Two menu options are listed on this dialog box: **Start menu** and **Classic Start menu**.

3. If necessary, change the current setting to be **Start menu**, which is the default and the recommended setting for installing Isight.
4. Click **OK**.

Determining the Control Panel Setting

The Windows Control Panel is used to access certain configuration features following the installation of Isight. It is also used when uninstalling the product. The procedures in this manual assume that you are using specific View options offered by the Control Panel interface.

1. Click the **Start** button, and click **Control Panel**.

This step assumes that you are using the default Windows **Start Menu** option as described in [Determining the Start Menu Setting](#).

The **Control Panel** dialog box appears.

2. Examine the view setting for your **Control Panel**:

- **Windows XP**. Examine the view setting in the upper left corner of the dialog box. One of the following two options will be listed (based on your operating system):

Switch to Category View. If this option is displayed, the **Control Panel** is currently in **Classic View**. For simplicity, it is recommended that you click this option to switch the **Control Panel** to **Category View**.

Switch to Classic View. If this option is displayed, the **Control Panel** is configured correctly to correspond with the installation procedures in this manual. No changes are necessary prior to installing Isight.

- **Windows Vista/Server 2008**. Examine the view setting in the upper left corner of the dialog box. One of the following two options will be listed (based on your operating system):

Control Panel Home. If this option is displayed in bold text with a small dot to its left, the **Control Panel** is configured correctly to correspond with the installation procedures in this manual. No changes are necessary prior to installing Isight.

Classic View. If this option is displayed in bold text with a small dot to its left, the **Control Panel** is currently in **Classic View**. For simplicity, it is recommended that you click the **Control Panel Home** option.

- **Windows 7**. Verify that **Category** is selected from the **View by** list in the upper right corner of the dialog box.

Determining Folder and File Extension Options

There are times, such as when you are removing the Isight software, when you must delete certain temporary directories that Windows hides by default. To delete these directories, you need to ensure your system settings are such that the directories are visible in the file structure.

In addition, since the procedures in this manual refer to file extensions (.exe, .bat, etc.), it is recommended that you ensure your system settings are such that these extensions are displayed.

1. Click **Start**, and click **Control Panel**.

This step assumes that you are using the default Windows **Start Menu** option as described in [Determining the Start Menu Setting](#).

The **Control Panel** dialog box appears.

2. Access the **Folder Options** dialog box using one of the following methods, based on your operating system:

- **Windows XP**: Click **Appearance and Themes**, and click **Folder Options**.
- **Windows Server 2003**: Double-click **Folder Options**.

-
- **Windows Vista/Server 2008/7:** Click **Appearance and Personalization**, and click **Folder Options**.
3. Click the **View** tab, and click **Show hidden files and folders**.
 4. Clear (uncheck) **Hide extensions for known file types**.
 5. Click **OK**.

The hidden directories and file extensions will now appear when browsing through your system's file structure.

Accessing the Installation Files from a Remotely Mounted DVD

If the UNIX/Linux system on which you are installing Isight does not have a DVD drive, you can use the DVD drive on a remote system to access the Isight installer and required files.

Local Installations Only on Windows Vista and Later

You cannot install Isight from a shared remote DVD drive on Windows Vista, Windows 7, or Windows Server 2008. The Isight installer must be on a local disk (hard drive or DVD), since it will not run via a Universal Naming Convention (UNC) path.

If you start the Isight installer as a non-administrator on Windows Vista, Windows 7, or Windows Server 2008, the system will prompt for an Administrator user name and password before the installer can run. The installer then runs in a temporary login session with no network disks mounted on drive letters.

On Windows XP, you can install Isight from a remote DVD drive if it has been defined as a shared folder. Setting up the DVD device as a share must be performed by a user with Administrator privileges. To install Isight from a shared remote DVD on Windows XP, map that drive to a local drive and perform the installation as if the drive were local. UNC paths are not supported by the installation procedures.

Installing Remotely on UNIX/Linux

You can install Isight from a remote UNIX/Linux DVD drive by mounting the DVD and copying the entire contents of the Isight DVD to a file system. This file system must be accessible from the system that will be running the Isight installation program.

1. Mount the Isight DVD.
2. Copy the entire contents of the DVD to a shared file system.

The UNIX utilities `cp -r` and `rcp` are convenient for copying these items. When copying files between different platforms (particularly between UNIX/Linux and Windows), special care may be needed to preserve the original file permissions and the file name case. In general, read and execute permissions on all files are sufficient for proper execution.

For more information, contact your local system administrator.

3. Depending on your platform, execute one of the following commands from the copy of the installation files to launch the installation procedure:
 - `./AIX/setupaix`
 - `./SUN/setupsolaris`
 - `./Linux/setuplinux`
4. Complete the Isight installation as described in [Installing Isight on UNIX/Linux](#).

Removing Old Releases of Isight

It is not usually necessary to remove previous releases of Isight installed on your system. The new installation is placed, by default, into a new directory based on the release number.

For the latest support information and tips on upgrading to the new release of the Isight, search the Dassault Systèmes DSX.ECO Knowledge Base at <http://www.3ds.com/support/knowledge-base>.

Re-installing Isight 5.7 on Top of Itself

Do not re-install Isight 5.7 into the same directory without uninstalling first.

After you have installed Isight 5.7, do not try to re-install it into the same directory. You must first uninstall it and then delete the entire installation directory up to the /5 . 7 / directory—follow the instructions in [Uninstalling on Windows](#) or [Uninstalling on UNIX/Linux](#).

Alternatively, you can re-install into a different directory.

This limitation also applies to the SIMULIA Execution Engine 5.7.

Prerequisites

Isight is supported on certain hardware and software configurations.

System Requirements

To function as designed, the system running Isight needs a certain amount of hard drive space and memory.

The following minimum system requirements are recommended:

- 1 GB of free disk space
- 32-bit installations: minimum 2 GB RAM (main memory) (4 GB RAM recommended)
- 64-bit installations: minimum 4 GB RAM (main memory) (6 GB RAM recommended)

Supported Platforms

Isight is designed to run on specific Windows, UNIX, and Linux platforms.

For complete details on the supported platforms for Isight, see the **System Requirements** section of the **Support** page at www.3ds.com/simulia.

Furthermore, there are UNIX-specific requirements that must be met prior to using Isight. For more information, see [Required Changes for UNIX/Linux Systems](#).

License Server Platforms

The FLEXnet license server software can be installed and run on Linux 64-bit, AIX, Windows 32-bit, or Windows 64-bit operating systems. The Dassault Systèmes (DS) license server can be installed and run on the following operating systems:

- Windows 32-bit or 64-bit
- Linux 64-bit
- AIX (UNIX)
- Solaris (UNIX)

FLEXnet licensing is not supported at all on Solaris for Isight 5.7 or SIMULIA Execution Engine 5.7. To use Isight on a Solaris workstation, it must use a DS license server. This is an absolute condition—you cannot install the FLEXnet license server on a non-Solaris machine for use with a Solaris Isight instance.

The Isight installer cannot automatically install the FLEXnet server on AIX. To run Isight on an AIX workstation, do one of the following:

- Use the Isight installer to install and run the FLEXnet license server on a Windows or Linux machine. Then install Isight on your AIX workstation, and refer to the Windows or Linux FLEXnet license server.
- Manually install and start the FLEXnet license server on your AIX workstation (along with Isight). See [Manually Installing the FLEXnet License Server on AIX](#) for instructions.

Required Changes for UNIX/Linux Systems

Prior to installing and running Isight on UNIX and Linux operating systems, you must verify and possibly alter settings specific to the operating system you are using.

X Windows Library Required for Linux

Isight 5.7 can only be run on 64-bit Linux platforms, but the 32-bit version of the X Windows library `libXext.so.6` is required for installation.

The Isight installer will not run correctly unless the 32-bit version of the X Windows library `libXext.so.6` has been installed in your 64-bit Linux operating system. This library is usually located in the file `/usr/lib/libXext.so.6`.

If this library file is missing from your operating system, the optional **libXext** (32-bit) package must be installed. The required RPM file is `libXext-1.1-3.el6.i686.rpm`, which is located in the `Packages/` directory of the RHEL 6 installation disk.

This prerequisite also applies to the SIMULIA Execution Engine 5.7.

Necessary Settings for AIX Systems

There are AIX-specific settings and changes that must be completed prior to installation to ensure that Isight functions properly.

Operating System Requirements

To ensure that execution on the AIX operating system is successful, you need to verify that the following patch level has been installed, based on your version of AIX:

- AIX v6.1: minimum AIX level 6100-GOLD

FORTRAN Library Requirements

If you are installing Isight on an AIX-based system, you need to verify that you have the FORTRAN run-time file (`libxlf90.a`) installed in the `/usr/lib/xlf` directory. This file is an optional add-on to the AIX operating system and may need to be installed manually.

Installations of Isight on the AIX platform require the following libraries:

- `xlf90 8.1.0.0 XL Fortran Runtime Environment`
- `xlf90.aix50 8.1.0.0 XL Fortran Runtime Environment AIX 5.0 Libraries`

Necessary Settings for Solaris Systems

There are Solaris-specific settings and changes that must be completed prior to installation to ensure that Isight functions properly.

Java Run-time Environment Requirements

You must install Solaris patches as described on the following web site:

<http://www.oracle.com/technetwork/systems/patches/solaris/index-jsp-139697.html>

Swap Space Settings

If you are installing Isight on a Solaris system, you must verify that the system has swap space equal to three or four times the main memory. The large amount of swap space is needed because Isight can grow to more than 500 MB. Additional swap space equal to the process size is allocated for a short time whenever the program creates a sub-process to execute an external program. This space is never used but must be available. Insufficient swap space will cause Isight jobs to fail sporadically with messages about “insufficient disk space.” Other versions of UNIX/Linux use a different scheme for allocating swap space to processes and can run Isight with swap space equal to twice the main memory.

Installing Isight

Instructions are provided to install Isight on supported Windows and UNIX/Linux platforms. Other tasks include migrating your Isight database and configuring licensing, if necessary.

Installation Overview

Several steps are required to successfully install the Isight software, depending on your installation environment.

1. Install the DS license server or FLEXnet license server to provide Isight desktop clients with licenses. The license server must be installed and running before you can install and start Isight desktop.
2. Install Isight desktop.
3. Migrate your existing Isight database, if desired, or create a new, empty database.

Installing or Configuring Licensing

You use the Isight DVD to install the license server software.

If you want all of your Isight desktop installations to use a single license file on a separate license server machine, install just the license server software on that machine.

During a typical installation of Isight desktop—for use as a standalone application or as a client for Isight distributed execution or the SIMULIA Execution Engine—the licensing options are configured automatically. However, if you received your license file after installing Isight, you must manually configure your license manager.

Installing the DS License Server

If you want to run the license server for Isight from a single (separate) server machine, you can install just the license server software. You should install Dassault Systèmes (DS) licensing if you received a DS license file from your sales representative.

It is usually convenient to perform the license server installation before installing Isight desktop on individual computers. Then when you install the separate instances of Isight desktop, you can refer to the license server machine to allow them to run.

Even if you install Isight desktop on just a single computer, you must still install one of the license servers on that machine. For more details about licensing, see [About Licensing and License Files](#).

Virtual machines, such as VMware, are not supported for DS licensing. It is not possible to install or run the Dassault Systèmes license server on a virtual machine.

Before you begin: You must have root privileges to install the DS license server on UNIX/Linux.

Install the DS License Server from the Isight Installer

You can install the DS license server during the standard installation wizard.

Note: On AIX, you cannot install the DS license server from the Isight installer; instead, follow the instructions below in *Install the DS License Server Directly from the DVD*.

1. Log in as an Administrator on Windows or as root on UNIX/Linux. Insert the Isight DVD.
See *Installing as an Administrator (Windows) or Non-Root User (UNIX/Linux)*.
2. Start the Isight installer as described in *Installing Isight on Windows* or *Installing Isight on UNIX/Linux*.
3. Click through the first few screens, choosing a directory in which to install the license server software.
4. In the third screen, choose **Dassault Systemes License Server** as the type of licensing to install.
5. Do the following, depending on your platform:
 - UNIX/Linux:
 - a) Click **Next**.
The software is installed silently in `/usr/DassaultSystemes/DSLICENSEServer/`, and the DS License Administration Tool is started. The license server program is running at this point.
 - b) You must enroll your Isight license keys on the license server; see “Enrolling Product Licenses” in the *DS License Server Installation and Configuration Guide*. If no license keys are registered, Isight can be installed to use the license server; however, Isight cannot actually be run.

Note: The license installer will fail if there is no `DISPLAY` environment variable set.

- Windows:
 - a) Click **Next**.
 - b) A GUI wizard runs to prompt you through the installation—follow the prompts in each succeeding screen to complete the installation.
 - c) In the wizard, choose one of the following:
 - **Install only Administration Tool**
 - **Install License Server and Administration Tool**

By default, the DS license server listens for license requests on port 4084. You can change this port assignment during the Windows installation.

Note: If you choose **Install DS server from scratch**, all existing license keys will be deleted.

- d) After the DS license server installation finishes, you must use the DS License Administration Tool to enroll your Isight license keys on the license server; see “Enrolling Product Licenses” in the *DS License Server Installation and Configuration Guide*. If no license keys are registered, Isight can be installed to use the license server; however, Isight cannot actually be run.

Install the DS License Server Directly from the DVD

You can run the DS license server installer separately from the DVD.

1. Log in as an Administrator on Windows or as root on UNIX/Linux. Insert the Isight DVD.
See *Installing as an Administrator (Windows) or Non-Root User (UNIX/Linux)*.
2. Do the following, depending on your platform:

- UNIX/Linux:
 - a) In a terminal shell, change directory (`cd`) to one of the following subdirectories (depending on your operating system):

```
<isight_dvd>/DSL/SL/AIX/  
<isight_dvd>/DSL/SL/SUN/  
<isight_dvd>/DSL/SL/RedHat/  
<isight_dvd>/DSL/SL/Suse/
```

- b) Execute the file `startInstLicServ`.

The software is installed silently in `/usr/DassaultSystemes/DSL/SL/Server/` and the DS License Administration Tool is started. The license server program is running at this point.

- c) You must enroll your Isight license keys on the license server; see “Enrolling Product Licenses” in the *DS License Server Installation and Configuration Guide*. If no license keys are registered, Isight can be installed to use the license server; however, Isight cannot actually be run.

Note: The license installer will fail if there is no `DISPLAY` environment variable set in UNIX/Linux.

- Windows:
 - a) Double-click on the executable file `<isight_dvd>\DSL\SL\SetupDSLMSi.exe`. The same executable can be used on both 32-bit and 64-bit Windows.
 - b) A GUI wizard runs to prompt you through the installation—follow the prompts in each succeeding screen to complete the installation.
 - c) In the wizard on Windows, choose one of the following:

- **Install only Administration Tool**
 - **Install License Server and Administration Tool**

By default, the DS license server listens for license requests on port 4084. You can change this port assignment during the Windows installation.

Note: If you choose **Install DS server from scratch**, all existing license keys will be deleted.

- d) After the DS license server installation finishes, you must use the DS License Administration Tool to enroll your Isight license keys on the license server; see “Enrolling Product Licenses” in the *DS License Server Installation and Configuration Guide*. If no license keys are registered, Isight can be installed to use the license server; however, Isight cannot actually be run.

Installing the FLEXnet License Server

If you want to run the license server for Isight from a single (separate) server machine, you can install just the license server software. You should install FLEXnet licensing if you received a FLEXnet license file from your sales representative.

It is usually convenient to perform the license server installation before installing Isight desktop on individual computers. Then when you install the separate instances of Isight desktop, you can refer to the license server machine to allow them to run.

Even if you install Isight desktop on just a single computer, you must still install one of the license servers on that machine. For more details about licensing, see [About Licensing and License Files](#).

The FLEXnet license server is not available on Solaris. FLEXnet for AIX cannot be installed from the Isight installer—it must be configured manually. See [Manually Installing the FLEXnet License Server on AIX](#).

Note: If the license server you are referencing is behind a Windows Firewall (the firewall supplied with most Windows installations), you will need to manually alter your Isight license. For more information, see [Configuring Your FLEXnet License to Work with a Windows Firewall](#).

1. Log in as an Administrator on Windows or as a non-root user on UNIX/Linux.
See [Installing as an Administrator \(Windows\) or Non-Root User \(UNIX/Linux\)](#).
2. Insert the Isight DVD and start the installer as described in [Installing Isight on Windows](#) or [Installing Isight on UNIX/Linux](#).

Note: Do not try to start the FLEXnet installer directly from the DVD; the installation environment will not be correct.

3. Click through the first few screens, choosing a directory in which to install the license server software. In the third screen choose **FLEXnet License Server** as the type of licensing to install, and click **Next**.
4. Follow the prompts in each succeeding screen to complete the installation.
5. Choose one the following:
 - **Install the licensing utilities and start the license server**
 - **Just install the licensing utilities**

You must have your FLEXnet Isight 5.7 `license.dat` file available on this computer—the installer will prompt you to enter the path to it.

Manually Installing the FLEXnet License Server on AIX

The procedure for installing the Isight FLEXnet license server on AIX involves copying specific files from the Isight DVD and running a command to perform the installation.

1. Log in as the user that will install the license server.
2. Insert the Isight DVD.
3. Navigate to the following directory on the Isight DVD:

`<isight_dvd>/license/AIX/`

4. Copy the files you find in this directory to the AIX workstation.

It is recommended that you copy the files to a directory named similarly to the following example:

`/opt/SIMULIA/License/`

5. Copy your Isight license file into the directory used in Step 4.
6. Rename the license file to `simulialm.lic`.
7. Type the following command:

```
./lmgrd -c simulialm.lic -L simulialm.log
```

Note: You can also install the license manager to start as a service. For more information, see [Configuring the FLEXnet License Server on Linux](#).

Upgrading an Existing FLEXnet License Server for Isight 5.7

If you are upgrading from Isight 5.6 or older, you must follow these steps to upgrade your FLEXnet license server.

Note: Your pre-existing FLEXnet license server software may have come with either Isight 5.6 or Abaqus 6.11 or 6.12.

1. Log in as an Administrator on Windows or as any user on UNIX/Linux.
See *Installing as an Administrator (Windows) or Non-Root User (UNIX/Linux)*.
2. Insert the Isight DVD, and start the installer as described in *Installing Isight on Windows* or *Installing Isight on UNIX/Linux*.
3. Click through the first few screens, choosing a directory in which to install the new FLEXnet software.
4. If the installer recognizes your existing FLEXnet license server, it offers you the option to **Upgrade your existing license server**.

Choose this option to allow the installer to automatically upgrade and restart the license server. Click **Next**. You are prompted to provide your new Isight 5.7 FLEXnet license file.

The installer will complete the upgrade and start the new license server automatically.

5. If the installer does not recognize your existing FLEXnet license server, it will display a message asking you to install the new license server on a different machine. If you cannot use a different machine, follow the steps below to manually upgrade the license server on this machine:
 - a) On the **Installation Type** screen of the installer, select **Just install the licensing utilities**.
 - b) Select a directory in which to install the new license server and utilities.
 - c) Follow the prompts in each succeeding screen to complete the installation. You can find the new FLEXnet files in the subdirectory `/License/` (under the directory you gave in Step b).
 - d) Copy your Isight 5.7 FLEXnet license file into the `/License/` subdirectory, and rename it `simulialm.lic`.
 - e) Use the FLEXnet utility `lmtools` (`lmtools.exe` on Windows) to configure the new license server to run as a service (see *Configuring the FLEXnet License Server on Windows*), or start the license server manually with this command:

```
lmgrd -c simulialm.lic
```

Note: You can also add the Isight 5.7 license keys to an existing FLEXnet license server, as long as the FLEXnet `lmgrd.exe` version is at least 11.6.1. Copy the executable file `ABAQUSLM.exe` from the SIMULIA license manager installation directory into the existing license manager directory. Merge the Isight license keys into your existing license file (see the *FLEXnet License Administration Guide* Version 11.6.1). Then stop and restart the license server.

Installing Isight Desktop

The Isight installation wizard, which is included on your Isight DVD, guides you through the process of installing Isight on your system. This wizard is used for both Windows and UNIX/Linux operating systems.

Installing Isight on Windows

To install Isight on a Windows system, you run the Isight installation wizard.

1. Log in as the Administrator that will install Isight.

You must be an Administrator user to install Isight; see [Installing as an Administrator \(Windows\) or Non-Root User \(UNIX/Linux\)](#).

2. Insert the Isight DVD.
3. If you are installing on Windows 7, Windows Vista, or Windows Server 2008, click **Allow** on the **User Account Control** dialog to confirm the execution of the installation program.

Note: If the installer does not start automatically, execute the `setupwin.exe` file located on the top level of the Isight DVD. This installation program is used for both the 32-bit and 64-bit versions of the software. Do not double-click the `setup.jar` file. Double-clicking the `setup.jar` file starts the installer using a local copy of Java, but the installation will later fail.

The Isight installation program starts, and the splash screen appears. The installation wizard will guide you through the installation process. The **Welcome** screen shows the release of Isight being installed.

4. Click **Next**.

The legal notice agreement screen appears.

5. Read the notice, and click **Next**.

The installation directory screen appears.

6. Perform one of the following actions:

- To accept the default directory, click **Next**. Your default directory may vary based on your system settings and permissions.
- If you want to install Isight in a different location, click **Browse**, choose a destination folder, and click **Open**.

Click **Next**.

7. Select **Isight Desktop** as the product to install, and click **Next**.
8. Select the type of license server software you will use with Isight, or skip the licensing selection for now:
 - **FLEXnet License Server**
 - **Dassault Systemes License Server**
 - **Skip license setup for now**

If you (or your system administrator) already have the FLEXnet or Dassault Systèmes license server installed and running, specify the server computer's name and (optionally) port number. This information is used to contact the license server and create a `license.dat` file that references the server. If you have installed a redundant license server triad, enter the host name and port for all three machines. The port number is found in your license file—the default is to leave this setting empty (the license manager software selects the port number).

Important: If the license server you are referencing is behind a Windows Firewall (the firewall supplied with most Windows installations), you will need to manually alter your Isight license. For more information, see [Configuring Your FLEXnet License to Work with a Windows Firewall](#).

For details about the choice of licensing scheme, see [About Licensing and License Files](#). For complete information about configuring the license server, refer to the appropriate documentation:

- *FLEXnet License Administration Guide* Version 11.6.1, which is available for download from the **Licensing** section of the **Support** page at www.3ds.com/simulia.
- *DS License Server Installation and Configuration Guide* (DSLS .pdf), which is available in the `Doc/` subdirectory of your Isight DVD.

Click **Next**.

9. In the next screen, select the type of Isight desktop client to install:

- **Standalone Isight**
- **Isight Distributed Execution**
- **Isight as a Client for the SIMULIA Execution Engine**

This choice sets up the initial connection profile (.cpr file). Additional connection profiles can be created later by using the **Edit Logon Profile** tool. See *Creating a SIMULIA Execution Engine Connection Profile* for more details.

10. Click **Next**.

After the installation program calculates the required disk space needed, an installation summary screen appears showing what will be installed and the location.

11. If necessary, start the license server software for Isight. Typically, this process is performed automatically by the license server installer. However, there are some cases when it must be done manually, including if you decided to provide Isight with a license at a later time. Be sure that you have acquired a license file before starting the license server. For more information, see [Configuring the FLEXnet License Server After Installation](#).

Installing Isight on UNIX/Linux

To install Isight on a UNIX or Linux system, you run the Isight installation wizard.

Root (superuser) privileges are not required to install Isight on UNIX or Linux. However, root permissions may be needed beforehand to grant the installing user write access to the installation directory; for example, in `/opt`.

If your computer does not have a DVD drive, you can install Isight from a shared disk or network folder. For more information, see [Installing on a Shared/Network Disk](#).

Installing on UNIX requires an X-Windows display, either local or remote over a network. If the `DISPLAY` environment variable is not set, the installer will not execute. Alternately, you can perform a silent installation without a display. For more information, see [Installing Isight Non-Interactively](#).

1. Log in as the user that will install Isight.

If you are not installing as root, it is recommended that you review the information in [Installing as an Administrator \(Windows\) or Non-Root User \(UNIX/Linux\)](#) before beginning your installation.

If you log in as a normal, non-root user and enable root/superuser privileges with the `su` command, you must use the “`su -`” command (`su` space dash) to read the root profile. Otherwise the installer may fail because required administrator utilities will not be in the executable path (`PATH`).

2. Load the Isight DVD and mount it, if necessary. For more information, contact your system administrator.

Note: On some UNIX/Linux systems, the Isight DVD will mount automatically when it is inserted into the DVD drive, and a file browser window will appear. In this case you can double-click the appropriate `setupXXXX` script file for your operating system (see Step 4).

3. From the terminal window (shell), change to the directory where the Isight DVD is mounted. For example, type:

```
cd /media/dvd
```

-
4. Execute the installation script by typing one of the following commands, based on your operating system:

- `./AIX/setupaix`
- `./Linux/setuplinux`
- `./SUN/setup_solaris`

The Isight installation wizard starts, showing the **Welcome** screen. This wizard will guide you through the rest of the installation.

5. Click **Next**.

The legal notice agreement screen appears. Read the notice, and click **Next**.

6. In the next screen, perform one of the following actions:

- To accept the default installation directory, click **Next**. Your default directory may vary based on your system settings and permissions.
- If you want to place Isight in a different location, click **Browse**, choose a destination folder, and click **Open**.

7. Select **Isight Desktop** as the product to install. Click **Next**.

8. Select the type of license server software you will use with Isight, or skip the licensing selection for now:

- **FLEXnet License Server**
- **Dassault Systemes License Server**
- **Skip license setup for now**

If you (or your system administrator) already have the FLEXnet or Dassault Systèmes license server installed and running, specify the server computer's name and (optionally) port number. This information is used to contact the license server and create a `license.dat` file that references the server. If you have installed a redundant license server triad, enter the host name and port for all three machines. The port number is found in your license file—the default is to leave this setting empty (the license manager software selects the port number).

The FLEXnet license server is not available and cannot be installed or run on AIX or Solaris.

Important: If the license server you are referencing is behind a Windows Firewall (the firewall supplied with most Windows installations), you will need to manually alter your Isight license. For more information, see [Configuring Your FLEXnet License to Work with a Windows Firewall](#).

For details about the choice of licensing scheme, see [About Licensing and License Files](#). For complete information about configuring the license server, refer to the appropriate documentation:

- *FLEXnet License Administration Guide* Version 11.6.1, which is available for download from the **Licensing** section of the **Support** page at www.3ds.com/simulia.
- *DS License Server Installation and Configuration Guide* (DSLIS .pdf), which is available in the `Doc/` subdirectory of your Isight DVD.

Click **Next**.

9. In the next screen, select the type of Isight desktop client to install:

- **Standalone Isight**
- **Isight Distributed Execution**
- **Isight as a Client for the SIMULIA Execution Engine**

This choice sets up the initial connection profile (`.cpr` file). Additional connection profiles can be created later by using the **Edit Logon Profile** tool. See *Creating a SIMULIA Execution Engine Connection Profile* for more details.

10. Click **Next**.

After the installation program calculates the required disk space needed, an installation summary screen appears showing what will be installed and the location.

11. If necessary, start the license server software for Isight. Typically, this process is performed automatically by the license server installer. However, there are some cases when it must be done manually, including if you decided to provide Isight with a license at a later time. Be sure that you have acquired a license file before starting the license server. For more information, see [Configuring the FLEXnet License Server After Installation](#).

Migrating Your Old Database to the New Format

You can migrate your existing Isight database to the new release's database format, allowing you to access all of the Isight model and execution data gathered using a previous release. This allows you to update the results database to the current release's format or to create a new, empty database for the current release. If you do not run the database migration utility, a new, empty Isight 5.7 database will be created the first time an Isight model is run.

The migration utility runs automatically the first time you start the Isight Design Gateway (if Isight detects a previous release of an Isight database). You can also run the migration utility manually using this command under your installation directory:

```
<isight_install_dir>/<os_dir>/code/command/migratedb -fd
```

where the `<os_dir>` subdirectory is one of the following:

intel_a	for 32-bit Windows
win_b64	for 64-bit Windows
linux_a64	for 64-bit Linux
solaris_a64	for Solaris
aix_a64	for AIX

In the default installation directory on 32-bit Windows, for example, you would execute the following batch file:

```
C:\SIMULIA\Isight\5.7\intel_a\code\command\migratedb.bat -fd
```

Stop all other Isight programs running on the computer (from any version of Isight) before starting the database migration utility. The migration utility will exit silently if there is no database to migrate.

Once the migration utility starts, follow the steps below.

Note:

Isight 5.6 and previous versions used MySQL as the built-in database; Isight 5.7 uses Apache Derby. MySQL 5.1 is not supported but is compatible with Isight 5.7.

If you want to download and configure a MySQL database to work with Isight 5.7, see the Dassault Systèmes DSX.ClientCare Knowledge Base at <http://www.3ds.com/support/knowledge-base>.

1. Verify that **Copy 5.6 data to your 5.7 database** is selected.
2. If you want to retain the old data in its original format (database), verify that **Preserve old 5.6 database** is selected.

Important: If you choose to preserve the previous data, it is important that you not use both releases of Isight at the same time. Both databases use the same port number, and your data will be corrupted.

Note: You may click **Cancel** to return to the installation process; however, upon starting Isight for the first time, you will be prompted to migrate the database.

3. Click **Create Database**.

Important: Do *not* click **Cancel** during the migration. This will result in corrupt data, and you will have to delete your previous database manually. By default, the database is located in one of the following directories:

- **Windows:** `C:\Documents and Settings\username\isightdb-xx\`
- **UNIX/Linux:** `/home/username/isightdb-xx/`

where *username* is the name of the user who installed Isight and *xx* is the release that you want to delete. In some earlier releases of Isight, the database is called *fiperdb* instead of *isightdb*.

The Isight preferences from an earlier release will be used to locate the database. If you moved the database in a previous release, the database for the new release will be in the same directory as the database for the earlier release.

Once the migration completes, a **Migration Completed** message appears.

4. Click **OK**.

5. Click **Finish**.

Uninstalling Isight

This section describes how to permanently remove Isight from your system.

Uninstalling on Windows

You can permanently remove Isight and the FLEXnet or DS license service at any time, as conditions warrant. This process involves stopping the license server and Isight, removing the software, and deleting any temporary directories and files that are left behind.

Typically, the uninstallation process removes the license server. If you have multiple FLEXnet license servers running on an individual computer, you may need to manually uninstall the license server as described in this section.

If you have multiple releases of Isight installed on a single computer using local FLEXnet license files, uninstalling one release of Isight may delete the FLEXnet license server used by the other installations. If your FLEXnet license server is deleted, you will need to reinstall the license server as described in [Installing the FLEXnet License Server](#).

Important: If you have two copies of the same release of Isight installed (for example, the initial release and a maintenance release that followed), you must directly access the uninstaller of the release you want to remove. It is recommended that you *not* use the Windows Control Panel as described in the following procedure. The uninstaller is located in the `_uninst` subdirectory of the main Isight installation directory for the release that you want to remove. Execute the `uninstall.exe` file in this subdirectory.

1. Login as the Administrator or a user with administrative privileges.
2. If the Isight Design Gateway or Runtime Gateway is running, stop it.
3. If you are running a FLEXnet license server with your Isight installation, you need to stop the server and remove it:
 - a) Open the **LMTOOLS** dialog box by performing one of the following options:
 - **Windows XP/Server 2003:** Click **Start**, point to **All Programs / Isight x.x**, and click **FLEXnet Utilities**.

-
- **Windows 2000:** Click **Start**, point to **Programs / Isight x.x**, and click **FLEXnet Utilities**.
 - **Windows Vista/Server 2008/7:** Click **Start**, point to **All Programs / Isight x.x**, right-click **FLEXnet Utilities**, and select **Run as administrator**.
- b) On the **LMTOOLS** dialog box, click the **Start/Stop/Reread** tab.
 - c) Select the Isight license service, and click **Stop Server** to stop the license server.
 - d) Click the **Config Services** tab.
 - e) Verify that the Isight service is select from the **Service Name** list, and click **Remove Service**.
 - f) Click **Yes** to verify the removal of the service.
 - g) Close the **LMTools** dialog box.
 - h) Uninstall/remove the **SIMULIA FLEXnet License Server** using the Windows **Add or Remove Programs** control panel or **Programs** control panel.
4. If you are running a DS license server, follow the instructions in the section "Uninstalling the Dassault Systemes License Server" of the *DS License Server Installation and Configuration Guide* (DSLS .pdf).
 5. Click **Start / Control Panel** to open the **Control Panel** dialog box.
 6. Perform one of the following options, based on your operating system:
 - **Windows 2000/XP/Server 2003:** Click **Add or Remove Programs**.
 - **Windows Vista/Server 2008/7:** Click **Programs**, and click **Programs and Features**.

The list of installed programs appears.

7. Select **Isight x.x** from the list of programs.
8. Click **Change/Remove (Uninstall/Change** on Windows Vista/Server 2008).
9. If you are installing on Windows Vista or Windows Server 2008, click **Allow** to confirm the start of the uninstallation wizard.

The **Welcome** dialog box appears.

10. Click **Next**.

A summary of the uninstallation appears.

11. Click **Next**.

The software is removed.

12. If you receive a message about removing modified files, click **Yes to All**.
13. Click **Finish**.

Note: If a message appears informing you that Isight has been removed and that you must restart your system to complete the uninstallation process, be sure to perform the restart before continuing to the next section.

14. If you are using Windows 2000, Windows XP, or Windows Server 2003, close the **Add or Remove** dialog box.
15. Close the Control Panel.
16. Navigate to the directory that contains the top level of your Isight installation. For example, if you installed Isight in C:\SIMULIA\Isight\5.7 , navigate to the C:\SIMULIA\Isight directory.
17. Delete the 5.7 directory and all of its contents.
18. Navigate to the following directory, where <username> is the name of the user who installed and uninstalled Isight:
 - **Windows 2000/XP/Server 2003:** C:\Documents and Settings\<username>\
 - **Windows Vista/Server 2008/7:** C:\Users\<username>\

19. Delete the following items, if they are present:

- `fiper.preferences` file
- `isightdb-57` directory
- `fiper` directory
- `Isightinstall.log` file
- `locallib_5.7` directory

20. Delete the following directories, if they are present:

- `C:\SIMULIA\License\`
- `C:\Program Files\Dassault Systemes\DS License Server\`

21. Navigate to one of the following directories, based on your operating system, where `<username>` is the name of the user who installed and uninstalled Isight:

- **Windows 2000/XP/Server 2003:** `C:\Documents and Settings\<username>\Local Settings\Temp\`
- **Windows Vista/Server 2008/7:** `C:\Users\<username>\AppData\Local\Temp\`

22. Delete the `fiper` and `fiperX.mmcachedirectories`.

The Isight removal process is complete.

Uninstalling on UNIX/Linux

You can permanently remove Isight and the FLEXnet or DS license service at any time, as conditions warrant. This process involves stopping the license server and Isight, removing the software, and deleting any temporary directories and files that are left behind.

Typically, the uninstallation process removes the license server. If you have multiple FLEXnet license servers running on an individual computer, you may need to manually uninstall the license server as described in this section.

Note: If you have multiple releases of Isight installed on an individual computer using local FLEXnet license files, uninstalling one release of Isight may delete the FLEXnet license server used by the other installations. If your FLEXnet license server is deleted, you will need to reinstall the license server as described in [Installing the FLEXnet License Server](#).

1. If the Isight Design Gateway or Runtime Gateway is running, stop it.
2. If you are running a FLEXnet license server with your Isight installation, you need to stop the server and remove it:

a) Perform one of the following actions:

- Log in as root (obtain root permissions).
- Verify that you have permission to write to the `/etc` directory.

b) Change to the following directory:

`<isight-install-dir>/License/`

c) Execute the following command to stop the FLEXnet license manager:

`./flexlm stop`

A message appears stating that your license manager was shut down successfully.

-
- d) Execute the following command:
- ```
./flexlm uninstall
```
- A message appears informing you that the FLEXnet startup script has been removed. The process is complete when you are returned to the prompt.
- e) Delete the directory `<isight-install-dir>/License/` (usually `/opt/SIMULIA/License/`).
3. If you are running a DS license server, follow the instructions in the section "Uninstalling the Dassault Systemes License Server" of the *DS License Server Installation and Configuration Guide* (DSLS.pdf).
  4. Verify that you are logged in as the same user that installed Isight.  
  
Important: You must be logged in as the same user that installed Isight or the uninstaller will not be able to completely remove the software.
  5. Navigate to the following directory:  
`<isight-install-dir>/_uninst/`
  6. Execute one of the following commands, based on your operating system:
    - `./uninstallaix`
    - `./uninstalllinux`
    - `./uninstallsolaris`  
The **Welcome** dialog box appears.
  7. Click **Next**.  
  
A summary of the uninstallation appears.
  8. Click **Next**.  
  
The software is removed. You are informed when the removal is complete.
  9. Click **Next**.  
  
A message appears telling you that you have to log out and then log back into your system to update your environment variables.
  10. Click **Finish**.  
  
The uninstaller is closed.
  11. Log out of your system, and then log back into your system.
  12. Log in as root (obtain root permissions).  
  
Although it is not necessary to be root to delete all the temporary files, it is necessary for some of the files.
  13. Navigate to the directory that contains the top level of your Isight installation.  
  
For example, if you installed Isight in `/opt/SIMULIA/Isight/5.7`, navigate to the `/opt/SIMULIA/Isight` directory.
  14. Delete the `5.7` directory and all of its contents.
  15. Navigate to the `$HOME` directory for the user that installed Isight.
  16. Delete the following items, if they are present:
    - `.fiper.preferences` file (notice the leading "." in the file name)
    - `locallib_5.7` directory
    - `isightdb-57` directory

- 
- `fiper` directory
  - any Isight logs (such as the installation and uninstallation logs)

**17.** Navigate to the following directory:

`/var/tmp/`

**18.** Delete the `flexlm.log` file (if it is present).

**19.** Delete any directories named `fiper_user`, where `user` is the user name of a someone who uses the system on which Isight was installed. These are Isight temporary directories.

The Isight removal process is complete.

---

# Configuration

There are several additional steps that may be necessary to enable Isight to function correctly. You may also need to make changes to your license file, depending on your network environment.

## User Login Names Containing Punctuation

Isight interfaces do not run correctly if they are started using a user login name (user ID) that contains punctuation marks—most notably !, #, ?, and : (exclamation point, pound sign, question mark, and colon). To avoid this problem, you must force the Isight installation and all temporary files into directories that do not contain these characters.

JAVA uses URLs internally to locate .jar files, and punctuation marks cause the URL to be misinterpreted. The problem is most common on Windows-based systems, where the default temporary directory is inside a directory named after the user name.

To correct this issue, you must first verify that Isight is not installed in a directory that contains any of these characters (other than the colon after the drive letter on Windows). Second, you need to manually set your temporary directory to a directory that does not contain these characters. On Windows, set the TEMP environment variable. On UNIX/Linux, set the TMPDIR environment variable. For more information on setting environment variables on your system, contact your local system administrator.

If the appropriate environment variable cannot be set, the variable FIPER\_TEMP can be used.

Finally, if you cannot set either the system environment variables or the FIPER\_TEMP variable, create a file called fiper.bat (Windows) or .fiper.sh (UNIX/Linux) in your home directory. Use this file to set the environment variable FIPER\_TEMP to a “safe” directory name. The contents of the new file will be similar to the following examples:

- Windows (fiper.bat)  
set FIPER\_TEMP=C:\TEMP\bang-user
- UNIX/Linux (.fiper.sh)

```
FIPER_TEMP=/var/tmp/bang-user
export FIPER_TEMP
```

## Configuring Your FLEXnet License to Work with a Windows Firewall

If you specified a FLEXnet license server that is behind a Windows Firewall, you need to edit your FLEXnet license file to ensure that it can connect to the license server when Isight is started.

1. Verify that the Windows Firewall has been updated so that the necessary license ports are open for the FLEXnet license server. For more information, contact your local system administrator.
2. Navigate to the following directory:

```
<isight_install_dir>\config\
```

3. Open the license.dat file in the text editor of your choice.

- 
4. Add the port number opened on the license server computer's Windows Firewall to the **SERVER** line in your FLEXnet license file. For example, if port 1700 was opened on the Windows Firewall, your license **SERVER** line would appear similar to the example shown below:

```
SERVER isightmachine ANY 1700
```

For more information on what port numbers were opened on your license server's Windows Firewall, contact your local system administrator.

5. Save and close your license file.
6. Start an Isight interface to verify that you can communicate with the FLEXnet license server.

## Configuring the FLEXnet License Server After Installation

If you receive your license file after installing Isight desktop, you will have to manually configure the license manager. If you had your license file and had the license server running prior to the Isight installation and used the Installation wizard to specify your license file or server, your license manager does not need any additional configuration and you can ignore this section.

The Isight license file is generated using the computer information that you provided to your SIMULIA representative. Depending on the type of license file you receive, you need to install and use either FLEXnet licensing or Dassault Systèmes (DS) licensing.

## Configuring the FLEXnet License Server on Windows

To configure FLEXnet licensing for Isight, you need to put your license file into the appropriate directory within your Isight installation and configure the FLEXnet license manager software.

You need to save your license file, which you most likely received via e-mail, to the correct directory. The license contains information about what features of Isight you can use. For the most part, you do not need to change anything in the file. However, some minor modifications may be necessary. If a local FLEXnet daemon is required and FLEXnet is not already configured on your system or network, you must also modify the FLEXnet service configuration.

1. Login as the Administrator or as a user with administrative privileges.
2. Save the license file you received by e-mail into the following directory and file name:  
`C:\SIMULIA\License\simulialm.lic`
3. Perform one of the following options, based on your operating system:
  - **Windows XP/Server 2003:** Click **Start**, point to **All Programs / Isight x.x** and click **FLEXnet Utilities**.
  - **Windows Vista/Server 2008/7:** Click **Start**, point to **All Programs / Isight x.x**, right-click **FLEXnet Utilities**, and select **Run as administrator**.

**Note:** You can also execute the `lmttools.exe` file from the command prompt to start the FLEXnet Utilities interface. This file is located in the `C:\SIMULIA\License\` directory. If you are using Windows Vista, Windows Server 2008, or Windows 7, run it using the **Run as administrator** option.

The **LMTOOLS** dialog box appears with the **Service/License File** tab selected.

4. Verify that **Configuration using Services** is selected, and click the **Config Services** tab.
5. Click **Browse** adjacent to the **Path to the lmgrd.exe file** text box.

An **Open** dialog box appears.

- 
6. Navigate to the following directory:

`C:\SIMULIA\License\`

7. Select the `lmttools.exe` file, and click **Open**.

The path appears in the corresponding text box on the **Config Services** tab.

8. Click **Browse** adjacent to the **Path to the license file** text box.

An **Open** dialog box appears.

9. Navigate to the following directory:

`C:\SIMULIA\License\`

10. From the **Files of type** list, select **License Files (\*.lic)**.

The license file appears in the **Open** dialog box.

11. Select the `simulialm.lic` file, and click **Open**.

The path appears in the corresponding text box on the **Config Services** tab.

12. Click **Browse** adjacent to the **Path to the debug log file** text box.

An **Open** dialog box appears.

13. Navigate to any directory in which you want to have the log file stored; for example,

`C:\SIMULIA\License\`.

14. Type the name of the log file in the **File name** text box. For example:

`simulialm.log`

15. Click **Open**.

The path appears in the corresponding text box on the **Config Services** tab.

16. Verify that the following two options at the bottom of the tab are selected:

- **Start Server at Power Up**. Selecting this option means that you do not have to manually start the license server. It is done automatically when your computer is started.
- **Use Services**. Selecting this option activates all of the settings on this tab. It must be selected before clicking **Start Server at Power Up**.

17. Click **Save Service**, and click **Yes** to verify your settings.

18. Click the **Start/Stop/Reread** tab.

19. Click **Start Server**.

The following message appears at the bottom of the dialog box to indicate that the FLEXnet license manager is running: `Server Start Successful`.

20. If the server fails to start after updating the service and you have an existing Isight Service defined, return to the **Configure Service** tab, delete the old service, and create a new service.

This new service should start without any errors.

21. From the **File** menu, select **Exit** to close the **LMTTOOLS** dialog box.

You can now start using Isight.

22. Access the Design Gateway to test your license file.

---

You will be prompted to publish the SIMULIA-supplied Isight components. Once the components are published, the Design Gateway interface appears, confirming that your license and license server are functioning correctly.

## Configuring the FLEXnet License Server on Linux

To configure FLEXnet licensing for Isight, you need to put your license file into the appropriate directory within your Isight installation and configure the FLEXnet license manager software.

You need to save your license file, which you most likely received via e-mail, to the correct directory. The license is a text file that contains information about what features of Isight you can use. For the most part, you do not need to change anything in the file. However, some minor modifications are necessary. Two scripts are provided with your Isight installation that assist you with installing and starting your FLEXnet license manager.

1. Save the license file you received by e-mail into the following directory and file name:

```
/opt/SIMULIA/License/simulia1m.lic
```

2. If you are using a combined license file with an existing FLEXnet license server, you must add the path to ABAQUSLM on the VENDOR line (second line) of the license file.

For example, if you installed Isight in the /opt directory, you would change the VENDOR from:

```
VENDOR ABAQUSLM
```

to the following:

```
VENDOR ABAQUSLM /opt/SIMULIA/License/ABAQUSLM
```

3. If your license file contains the string XXXX on the SERVER line, replace the XXXX string with the host name of your computer.

The host name of the computer may be determined by typing the command `uname -n` at the terminal prompt.

4. Save and close your license file.
5. To install the license manager as a service, perform one of the following actions:
  - Log in as root (obtain root permissions).
  - Verify that you have permission to write in the /etc directory.

6. Execute the following command:

```
./flexlm install
```

A message appears, informing you that the FLEXnet startup script is being installed. The process is complete when you are returned to the prompt.

7. Execute the following command to manually start the license manager:

```
./flexlm start
```

Note: If you did not have root privileges when you installed Isight, you will have to execute this command every time you reboot your system. A warning message stating this necessity appeared during your installation. Otherwise, the license manager will start automatically after a reboot.

A message appears stating that your license manager was started successfully. You can now start using Isight.

8. Access the Design Gateway to test your license file.

---

You will be prompted to publish the SIMULIA-supplied Isight components. Once the components are published, the Design Gateway interface appears, confirming that your license and license server are functioning correctly.

---

# Reference Information

You can install Isight non-interactively, if desired. Several environment variables are set automatically by the Isight installer.

## Installing Isight Non-Interactively

You can install Isight with minimal interaction, instead of using the installation wizard.

## Installing Using the Default Settings

You can install Isight using a single command. When this option is used, Isight is installed using all of the default settings.

1. Open a **Command Prompt** dialog box (Windows) or a terminal window (UNIX/Linux).
2. Enter one of the following commands, based on your operating system:

- **Windows:**

```
D:\Windows32\setupwin.exe -silent
```

(where D: is your DVD drive letter)

- **UNIX/Linux:**

```
<dvd_mount_point>/PLATFORM/setupPLATFORM -silent
```

(where *dvd\_mount\_point* is specific to your system, and *PLATFORM* specifies the type of UNIX/Linux operating system you are using)

**Note:** A default installation does not install any license server and or a client license file. You must manually create a client license file as described in [Client and Server License Files](#).

## Installing With Pre-Determined User Responses

You can create a file during a standard Isight installation that stores all of your installation settings. Once created, this file can be used to automatically configure any additional Isight installations.

1. Open a **Command Prompt** dialog box (Windows) or a terminal window (UNIX).
2. Enter one of the following commands, based on your operating system:

- **Windows:**

```
D:\Windows32\setupwin.exe -options-record C:\Temp\options.txt
```

(where D: is your DVD drive letter)

- **UNIX/Linux:**

```
<dvd_mount_point>/PLATFORM/setupPLATFORM -options-record /tmp/options
```

(where *dvd\_mount\_point* is specific to your system, and *PLATFORM* specifies the type of UNIX/Linux operating system you are using)

---

The last argument to the setup program is the path to the file where the setup options are stored. This must be an absolute path, as the installer internally does a “cd” to an unwritable directory.

3. When the installation interface appears, perform the installation procedures as usual. Once completed, the setup options are stored in the specified text file.
4. Enter one of the following commands, based on your operating system:

- **Windows:**

```
D:\Windows32\setupwin.exe -silent -options C:\Temp\options.txt
```

- **UNIX/Linux:**

```
<dvd_mount_point>/PLATFORM/setupPLATFORM -silent -options /tmp/options
```

The last argument to the setup program is the path to the file where the setup options are stored. This must be an absolute path, as the installer internally does a “cd” to an unwritable directory.

The software is installed.

## Environment Variables

Several environment variables are set automatically by the Isight installer. These variables are used primarily for creating custom Isight add-ons and do not need to be set for typical operation.

The following environment variables are set:

- FIPER\_HOME\_57 = *<isight-install-dir>*
- FIPER\_HOME= *<isight-install-dir>*
- PATH (on UNIX/Linux only)

Note: Since the Isight installation program must be run by a user in the Administrators group (on Windows), the environment variables are set for all users. On UNIX/Linux, these variables are set only for the user installing Isight (in the user’s `.profile` file).

## About SIMULIA

SIMULIA is the Dassault Systèmes brand that delivers a scalable portfolio of Realistic Simulation solutions including the Abaqus product suite for Unified Finite Element Analysis; multiphysics solutions for insight into challenging engineering problems; and lifecycle management solutions for managing simulation data, processes, and intellectual property. By building on established technology, respected quality, and superior customer service, SIMULIA makes realistic simulation an integral business practice that improves product performance, reduces physical prototypes, and drives innovation. Headquartered in Providence, RI, USA, with R&D centers in Providence and in Vélizy, France, SIMULIA provides sales, services, and support through a global network of regional offices and distributors. For more information, visit [www.3ds.com/simulia](http://www.3ds.com/simulia).

## About Dassault Systèmes

As a world leader in 3D and Product Lifecycle Management (PLM) solutions, Dassault Systèmes brings value to more than 100,000 customers in 80 countries. A pioneer in the 3D software market since 1981, Dassault Systèmes develops and markets PLM application software and services that support industrial processes and provide a 3D vision of the entire lifecycle of products from conception to maintenance to recycling. The Dassault Systèmes portfolio consists of CATIA for designing the virtual product, SolidWorks for 3D mechanical design, DELMIA for virtual production, SIMULIA for virtual testing, ENOVIA for global collaborative lifecycle management, and 3DVIA for online 3D lifelike experiences. Dassault Systèmes' shares are listed on Euronext Paris (#13065, DS4.PA), and Dassault Systèmes' ADRs may be traded on the US Over-The-Counter (OTC) market (DAST4). For more information, visit [www.3ds.com](http://www.3ds.com).

Isight, the 3DS logo, and SIMULIA are trademarks or registered trademarks of Dassault Systèmes or its subsidiaries in the United States and/or other countries. Other company, product, and service names may be trademarks or service marks of their respective owners.
